The present invention provides the protein and coding sequences of novel proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Isolated polypeptide for treatment of diseases, diagnostics, raising antibodies and research use

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence data for this patent did not form part of the printed

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and containing and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and constants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              printed

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ά

The present invention relates to the isolation of human polynucleotide sequences that are differentially expressed during foam cell differentiation. The polynucleotide sequences of the invention or a composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as a therosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotide sequences can also be used as PCR primers and probes. The polynucleotides of the invention are also useful in gene therapy. AAS94746-AAS95021 represent the human polynucleotide sequences of the invention are also expressed during foam cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Composition useful for diagnosis of conditions, disorders or diseases associated with atherosclerosis, comprises several polynucleotides that are differentially expressed in foam cell development -

                                                                                                                                                                                                                                                                                                                                                  This sequence encodes a human protein which contains a SRCR (scavenger receptor, cysteine-rich) domain. The gene and encoded protein can be used to diagnose or treat tumnours, particularly of the nervous system (medullo-blastoma or glioma) or breast. The DNN: sequence and probes derived from it, are used to identify genes that express SRCR-domain containing proteins, to determine the form in which these proteins exist and to assess the significance of individual forms on cellular properties. The protein can be used to detect the presence of autoantibodies and antibodies which regulate its expression.

relates to an isolated novel secreted polypeptide (I) and (II). (I) and (II) are useful for treating cancer, Iseases, wound healing disorder, infections, hematopoletic filammatory disorders, infertility, neurological and iseases, cardiovascular diseases, respiratory diseases, cardiovascular diseases. These may also be used to ss, an organities and disorders caused by abnormal production, function and/or metabolism of the genes, as inducing immunological response in a mammal, and in those for detecting the effect of added compounds on the mRNA and polypeptide in cells. The polypeptides can be used s to produce antibodies immunospecific for the polypeptides, it membrane-bound or soluble receptors. The polypeptides is standardior studies, in chromosome localisation studies, is expression studies. The present sequence represents the ce of novel human secreted protein #19.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 teins or polypeptides, useful for treating e.g. cancer, ses, wound healing disorder, infections, haematopoietic mmatory disorders, infertility, cancer

AAA41261 to AAA43419 represent specifically claimed secreted expressed sequence tags (SESTS), isolated from human, mouse, xenopus and rat tissue sources. The SESTS can have a range of activities depending on the tissues they were isolated from. The activities include: the tissues they were isolated from. The activities include: chemokinetic; analgesic; haemostatic; thrombolytic; antidiabletic; chemokinetic; antipacterial; antidiadal; antidiabletic; cytostatic, antipackinsonian; antipsoriatic; cerebroprotective; cototropic; antipackinsonian; antipsoriatic; cerebroprotective; anticonvulsant; and antidepressant. The SESTS can be used for gene therapy and in vaccines. The SESTS are useful as probes for the identification and isolation of full-length conversed by the SESTs centibodies. They may be useful for treament of autoimmune disorders are useful in assays for determining biological activity and raising are useful in assays for determining biological activity and raising are useful in assays for determining biological activity and raising (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, osteoarthritis, central nervous system disorders (cathma) myeloid or lymphoid cell deficiencies, wounds, burns, ulcers, osteoporosis, parkinson's, Huntington's disease, stroke), coagulation diseases, tumours, bacterial, fungal or viral infections, depression and psoriasis. AAAA43420 to AAA43425 represent invention.
                                                                                                       Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (SESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   80 ralaSerThrValValCysLysGlnLeuGlyCysProPheSerPheAlaMetPheArgPh 100

AAM25965 to AAH99904 encode the human proteins given in AAM25255 to
AAM25963. The proteins can have activities based on the tissues and
cells they are expressed in, such as: antinflammatory; antisheumatic;
central they are expressive; antibacterial; endocrine; cardiant;
central nervous system; virucide; anti-HIV; fungicide; antimutagen;
cardiovascular; antianaemic; antiaggregant; haemostatic; vulnerary;
antiplorarinsonian; and immunostimulant. The proteins and polynucleotides
antiplarkinsonian; and immunostimulant. The proteins and polynucleotides
conciding them can be used in gene therapy, antisense therapy and vaccine
production, The proteins and polynucleotides are useful for screening for
agonists or antagonists of a protein and for the treatment and diagnosis
of disorders associated with the activity of a protein e.g. inflammation,
rheumatoid arthritis, septic shock, pancreatifis, cardiac dysfunction,
neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal
infections, autoimmunity, genetic diseases, hemmatopoietic disorders,
anaemia, platelet disorders, thrombooytopaenia, wounds, burns, ulcers,
costeoporosis, severe combined immunodeficiency, cardiac,
costeoporosis, severe combined immunodelians.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     675

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           BI009799

polylinker; Site_l: Not I; Site_2: Eco RI; The UNL-P-FN
library is a normalized library representing porcine
ovarian follicles, ranging between 2.0 to 10.0 mm in
diameter, collected during 7 days of the follicular phase
of the pig estrous cycle. This library was derived from
the library UNL-P-F2. The tag is a string of 5-6
nucleotides present between the Not I site and the
oligo-dT track. The library was constructed as described
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Oligo-dT track not found, Not I site shown in beginning of sequence is likely internal to the message. /note="Organ: Kidney_tumor; Vector: puc18; Site_1: Smal; Site_2: Smal; A mini-library was made by cloning products derived from ORESTES PCR (U.S. Letters Patent application No. 196,716 - Ludwig Institute for Cancer Research) profiles into the pUC 18 vector. Reverse transcription of tissue mRNA and cDNA amplification were performed under 10m stringency conditions.

BI009795 GI:14413866
                /note="Organ: lung; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCL_CGAP_LuS was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1414920-14179) and 1520904-1522439). Subtraction by Bento Soares and M. Fatima Bonaldo.
